

Annual solar power generation wattage in Toronto Canada

Overview

If many buildings and large parking lots in the city were to install solar systems, Toronto could generate up to 12 terawatt-hours (TWh) per year of clean energy (see Table 1). This is a staggering figure: equivalent to more than 50% of Toronto's total electricity. This web mapping application gives estimates of photovoltaic potential (in kWh/kWp) and of the mean daily global insolation (in MJ/m² and in kWh/m²) for any location in Canada on a 60 arc seconds ~2 km grid. The photovoltaic (PV) potential represents the expected lifetime average electricity. Canada's total wind, solar and storage installed capacity grew 46% in the past 5 years (2019-2024), including nearly 5 GW of new wind, 2 GW of new utility-scale solar, 600 MW of new on-site solar, and 200 MW of new energy storage. The average daily energy production per kW of installed solar capacity varies by season: 6.3 kilowatt hours per day (What's a kilowatt hour?

). For us, that works out to about half of the power we use in our house each day.
