

# Bulgarian energy storage project peak-valley electricity price difference

CE UN38.3 

## Overview

---

The electricity price during peak hours is 1. The Association for Production, Storage and Trading of Electricity (APSTE) warned that the government's disproportionately high fees for photovoltaic panels and energy storage batteries are preventing the possibility of having permanently low electricity prices in Bulgaria. In May 2023, electricity generation from coal power plants slumped 58% compared with the previous May, while solar PV had its monthly contribution grow by more than 30%. Notably, PV also had its highest ever share of. In different European countries, the peak-valley price difference varies, and the impact on energy storage projects is also different. The thermal output decline was partially countered by unsurpassed generation from solar. The primary profit model for energy storage in microgrids is “ peak-valley arbitrage ”—charging during low-demand periods when electricity prices are low and discharging during high-demand periods to supply users within the microgrid.
