

# Can prefabricated buildings be equipped with photovoltaics

## Overview

---

Therefore, almost all models are available with a photovoltaic system that is optimally adapted to the respective roof size. The use of renewable energy sources (RES) in the national energy sector is increasing significantly, and previously unused areas are increasingly developed for photovoltaic power plants. A specific type of housing common in Eastern European countries opens an additional opportunity for photovoltaic. Prominent examples in power generation include the discovery of the photovoltaic effect by Edmund Becquerel in 1839 and the development of the first commercial solar panel by Charles Fritts later that century. These milestones have enabled the integration of solar panels as essential components of. Photovoltaic (PV) technology is an ideal solution for the electrical supply issues that trouble the current climate-change, carbon-intensive world of power generation. PV systems can generate electricity at remote utility-operated "solar farms" or be placed directly on buildings themselves. In addition, this system works completely noiseless, another contribution to good living comfort.
