

# Causes of abnormal power generation of photovoltaic panels

## Overview

---

Gradual decline in the energy output of solar panels over time due to various factors such as material wear, environmental exposure, and manufacturing defects. These issues can arise from hardware malfunctions, poor network configurations, or interference in wireless connections. When communication fails. With the global increase in the deployment of photovoltaic (PV) modules in recent years, the need to explore and understand their reported failure mechanisms has become crucial. Corresponding to different types and natures, such faults prevent the PV systems from achieving their nominal power output and attaining the required level of energy production if the fault in solar PV. Causes and solutions for abnormal power generation of PV plants. Generally, under power frequency, if the RMS (Root Mean Square) value of the AC voltage rises to more than 10% above the rated value and lasts for more than 1 minute.
