

# Communication green base station cavity

---

## INTEGRATED DESIGN

EASY TO TRANSPORT AND INSTALL,  
FLEXIBLE DEPLOYMENT

## Overview

---

Cavity filter in mobile communication base system In mobile base stations, cavity filters are used to separate signals from different frequency bands, ensuring signal clarity and stability. They selectively transmit signals at specific frequencies while suppressing interference from. This study presents an overview of sustainable and green cellular base stations (BSs), which account for most of the energy consumed in cellular networks. We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the. To ensure the stable operation of equipment, a sealed structural design must be adopted, which makes it difficult for heat in the internal cavity to be dissipated through natural convection, forming the core contradiction between “sealing and heat dissipation”. Recognizing this, Mobile Network Operators are actively prioritizing EE for both network maintenance and environmental stewardship in future cellular networks.
