## Overview

---

At its core, bidirectional charging flips the typical path: instead of AC from the grid becoming DC for the battery, stored DC is inverted back to AC for a load or feeder. This conversion can occur in the vehicle using an onboard inverter or in the charger using an. EVs with bidirectional (two-way) charging capability can be used to power a home, feed energy back into the electricity grid and even provide backup power in the event of a blackout or emergency. Types: Includes Vehicle-to-Grid (V2G), Vehicle-to-Home (V2H), Vehicle-to-Load (V2L), and Vehicle-to-Vehicle (V2V) for grid support. The Enphase App optimizes charging, backup, and export using intuitive software control. Unlike standard EV chargers, which use regular AC (alternating current) power for charging, bidirectional. vehicle-to-grid (V2G) functionality. This product will leverage the power of grid-forming IQ8™ Microinverters and Ensemble™ energy management technology to seamlessly integrate into Enphase® home energy systems, and will enable homeowners to manage their solar, battery storage, and EV (electric).

### Bidirectional Charging

What Is Bidirectional charging?Types of Bidirectional ChargingEvs with Bidirectional ChargingWhat Are The Benefits of Bidirectional charging?What's The Difference Between Bidirectional Charging and Smart charging?FAQsBidirectional charging, often referred to as two-way charging, is a technology that allows electric vehicles to not only consume electricity from the grid but also feed energy back into it. In traditional charging systems, electricity flows unidirectionally from the grid to the vehicle. In bidirectional charging, this flow can be reversed, enabling See more on ev-lectron Enphase
