

Design principles of solar thermal storage materials

Overview

This review comprehensively examines key principles of design modifications and energy storage in SAHs to enhance thermal performance, focusing on storage materials, system designs, and performance factors. The storage concept comprises the strategies - which are adjusted to the particular. The manuscript aims to review and discuss the various types of storage that have been developed, specifically thermochemical storage (TCS), latent heat storage (LHS), and sensible heat storage (SHS). Among these storage types, SHS is the most developed and commercialized, whereas TCS is still in. Thermal storage technologies have the potential to provide large capacity, long-duration storage to enable high penetrations of intermittent renewable energy, flexible energy generation for conventional baseload sources, and seasonal energy needs. It is an effective way of decoupling the energy demand and generation, while plays an important role on smoothing their fluctuations.
