

Distributed photovoltaic inverter is adjustable

Overview

Multi-channel design: Distributed photovoltaic inverters usually have multi-channel independent MPPT channels that can connect different directions or different types of photovoltaic panels to adapt to complex lighting conditions and module layout. Although the term “advanced inverters” seems to imply a special type of inverter, some of them use a distributed approach - utilising multiple string inverters throughout a solar array. But now that a variety of choices exist, the challenge is inverters due to the cost and utility interactive controls from a plant management perspective. This solution refers to the solution of decentralized MPPT optimization and centralized grid-connected power.

Distributed photovoltaic inverter is adjustable

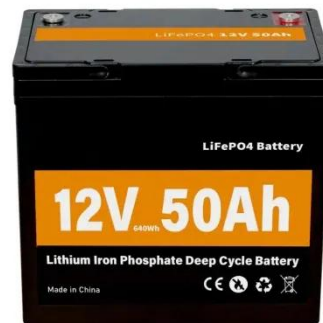

Distributed Solar Power Generation

Two implementations are possible using either micro-inverters or power optimizers.
