

# Energy storage container air duct design scheme

## Overview

---

A personalized uniform air supply scheme in the form of “main duct + riser” is proposed for the energy storage battery packs on the left and right sides of the container. Ventilation systems are key for fresh air. Energy recovery. cus on air duct design and control systems. The air duct structure comprises a top plate and a baffle, wherein the left side and the right side of the top plate are connected with side. Energy storage technology can effectively achieve user demand side management, eliminate day and night peak valley differences, smooth loads, reduce power supply costs, promote the utilization of renewable energy, improve the stability of power grid system operation, improve power quality, and. The main point of the design of forced air-cooling technology is to control the air duct to change the wind speed: due to the different energy density and capacity of the batteries in the energy storage system, the battery placement and arrangement structure are different, so the air duct inside. Design requirements for air ducts in hether it is new construction or an energy upgrade retrofit. Both system noise and noise at the air outlet are important omfort considerations in the air distribution system y limiting the accumulation of hydrogen in the battery room.
