

# Energy storage power station gas emission standards

## Overview

---

Emission guidelines for the longest-running existing coal units and standards for heavily-utilized new gas units are based on carbon capture and sequestration/storage (CCS) – an available and cost-effective control technology that can be applied directly to power. Emission guidelines for the longest-running existing coal units and standards for heavily-utilized new gas units are based on carbon capture and sequestration/storage (CCS) – an available and cost-effective control technology that can be applied directly to power. On April 25, EPA issued final carbon pollution standards for power plants that will protect public health and reduce harmful pollutants. The power sector is the largest stationary source of greenhouse gases (GHGs). The rule establishing greenhouse gas (GHG) standards enables power plants to use any alternative fuel or technology provided it meets the applicable emission rate. EPA highlights that through the Inflation Reduction Act (IRA) 024), <https://www.> This flexibility makes electricity systems modeling important to understand the potential. Aiming to address this, the Environmental Protection Agency (EPA) issued finalized carbon pollution standards in May 2024, which would regulate carbon dioxide (CO<sub>2</sub>) emissions from existing coal and new gas-fired power plants. We analyze what the new rules mean for electric power GHG and conventional pollutant emissions into the next decade.
