

# Home solar integrated machine only works for two hours

## Overview

---

When lights only manage two hours of illumination, the issue is a fundamental mismatch between the energy collected and the energy consumed. Troubleshooting the system involves examining the three main components: the solar panel, the rechargeable battery, and the light fixture. This technology relies on a small solar panel to charge an internal battery during the day, which powers an LED bulb at night. By sheer luck I can get it to restart and it will work for half a day then go back to not generating despite full sublight being available. 7V 2000mAh battery stores only 7.4Wh—enough for 2-3 hours with a 3W LED. Moreover, charge-discharge cycles degrade capacity by 15-20% annually, slashing runtime further. Pro Tip: Swap NiMH for LiFePO4; their 2000+ cycles outlast. This guide explains the most common causes of inconsistent solar production, how to safely troubleshoot the problem, and why intermittent issues are a major warning sign that your system needs professional diagnostics before more damage occurs. If you're using an Enphase system and see a Low Solar Production alert, here's what you can check: Look outside—is it cloudy or snowy?

If yes, wait for. This article not only talks about the common solar panel performance issues but also presents troubleshooting tips. Let's dive deeper into the discussion. Before you start the troubleshooting task, it is crucial to ensure your personal safety.

## Why Solar Light Works Only For Few Hours?

Think of solar lights as crops--they thrive in summer, struggle in winter. A 10Wh

battery fully charged in summer lasts 5 hours (2W LED), but winter's 4.2Wh charge allows only 2 hours.
