

# How does the wind blow the wind turbine

## Overview

---

When wind passes over the rotor blades of a turbine, it creates lift (similar to an airplane wing), causing the blades to spin. Wind is a form of solar energy caused by a. The workings of a wind turbine are much different, except that instead of using a fossil fuel heat to boil water and generate steam, the wind is used to directly spin the turbine blades to get the generator turning and to get electricity produced. They can be stand-alone, supplying just one or a very small number of homes or businesses, or they can be clustered to form part of a wind farm. Here we explain how they work and why they are. How does a turbine generate electricity?

A turbine, like the ones in a wind farm, is a machine that spins around in a moving fluid (liquid or gas) and catches some of the energy passing by. All sorts of machines use turbines, from jet engines to hydroelectric power plants and from diesel railroad. Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan— wind turbines use wind to make electricity. For millennia, humans have harnessed the power of wind.

## How does the wind blow the wind turbine

---

### How does a wind turbine work?

When wind blows past a plane's wings, it moves them upward with a force we call lift; when it blows past a turbine's blades, it spins them around instead. The wind loses some of its ...

### How a Wind Turbine Works

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan-- wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...

---

### Wind Turbine

When the wind blows across the blade, the air pressure on one side drops. Lift and drag are created by the difference in air pressure between the two sides of the blade. The lift force is ...

### How Do Wind Turbines Work? , NOVA , PBS

Rather than being pushed like sails, wind turbine blades act more like airplane wings. They're shaped so that wind flows at different speeds above and below them.
