

# How to ground a solar telecom integrated cabinet with high voltage

## Overview

---

MGB should be mounted as low as possible in the cabinet (shorter lead to Ground Electrodes) Surge protection should always be discharged directly to MGB using dedicated cable/wire. I would like some advice on grounding. The existing 480V service has an 800A fused main disconnect before the MLO panelboard. The Neutral and ground bond is in the main disconnect. In the United States the term "Grounding" can mean many different things, depending on the electrical applications. As engineers its important to use the correct terms Grounded Conductor - aka "Neutral" used in 120/240; 120/208; 240 High Leg and 277/480V application. Telecom-munication sites installed within high voltage environments are exposed to the same fault conditions as the towers and substa-tions, therefore, the protection of personnel and equipment at these sit s is a critical. The NEC is the primary guiding document for the safe designing and installation practices of solar PV systems in the residential and commercial markets in the United States.

## Guidelines for Designing Grounding Systems for Solar PV Installations

In this regard, a main bonding jumper (MBJ) should be installed to connect the EGC to the neutral of the supply at one point only (see figure below). This is true for a solidly grounded system.
