

# Is cracks on photovoltaic panels a big problem

## Overview

---

The smallest imperfections in solar panels can lead to big problems down the line. These sneaky cracks can come from all sorts of places - a rough ride during shipping, a. In-situ electroluminescence (EL) imaging determined that cell cracks were the primary cause of PV module damage in these particular cases. As a result, the hail damage insurance market has tightened, with many project owners struggling to obtain suitable coverage. Repair cracked solar panels using appropriate techniques such as epoxy resin injection or module replacement to optimize energy production and system. Why microcracks are killing your solar panels?

A number of years ago, cell microcracks, hot spots, and PID effects used to be three important factors affecting the performance of crystalline silicon PV modules. The silicon used in solar PV cells is very thin (in the range of 180 +/- 20 microns) and hence is susceptible to damage easily if the PV module's.

### Cell cracks in PV modules: How should you be concerned?

Components with cell cracks will produce less electricity, especially if the cracks disconnect an area of the cell from its connection. In some regions, the severity and frequency of extreme weather events are increasing.
