

# Is the battery of the communication base station grounded

## Overview

---

The central battery is always grounded to the positive pole, the reason is that it can ensure that the wire potential of the components in the switch is lower than the ground potential. Effect: Negatively charged metal conductors are less prone to. This article clarifies what communication batteries truly mean in the context of telecom base stations, why these applications have unique requirements, and which battery technologies are suitable for reliable operations. The phrase “communication batteries” is often applied broadly, sometimes. Good electrical grounding is mandatory, both by local and national electrical codes, but also by good engineering design of your ham station. Not only in performance, but if you're running high power, there are health risks involved with stray RF emissions. I know of cases where operators have gotten shocks while keying up and touching the mic to their lips. Proper grounding will. The current communication power supply voltage level is divided into DC-48V (+24V), AC 220/380V.

## Is the battery of the communication base station grounded

## Tower and Base Station Antenna Grounding

The short answer is that yes, your tower, antenna, and coax may share a ground. In fact, their grounds are required to be

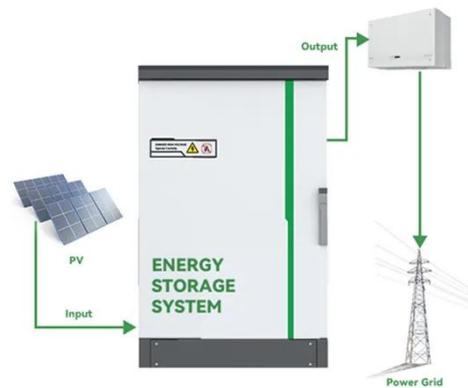

bonded (connected) to each other and to your electrical system ground.
