## Strange fuse requirements on the \*negative\* side of the battery

In EU usually control power has the negative side to chassis ground/PE to trip an overcurrent protection in case of wiring fault. This is usually done for batteries, too (if they supply control power).

### Why do cables and batteries have a positive and a negative side?

Electrons flow out one side (the negative one) and come back in from the other (the positive one). Current is not associated with electron accumulation, but with electron flow.
