

# Large-capacity flywheel energy storage

## Overview

---

First-generation flywheel energy-storage systems use a large steel flywheel rotating on mechanical bearings. Newer systems use carbon-fiber composite rotors that have a higher tensile strength than steel and can store much more energy for the same mass. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the. With a power output of 30 megawatts, China's Dinglun flywheel energy storage facility is now the biggest power station of its kind. ESSs store intermittent renewable energy to create reliable micro-grids that run continuously and efficiently distribute electricity by balancing the supply and the load [1]. For discharging, the motor acts as a generator, braking the rotor to.

## Large-capacity flywheel energy storage

---

### China connects world's largest flywheel energy storage system to grid

China has developed a massive 30-megawatt (MW) FESS in Shanxi province called the Dinglun flywheel energy storage power station. This station is now connected to the grid, making it the largest

## Technology: Flywheel Energy Storage

Large synchronous flywheels are also used for energy storage, yet not to be

mistaken with FESS. They use very large flywheels with a mass in the order of 100 tonnes. These are directly connected to a synchronous ...
