The work begins with outlining the main components and energy consumptions of 5G BSs, introducing the configuration and components of base station microgrids (BSMGs), as well as categorizing the energy management systems (EMSs) and communication network. The work begins with outlining the main components and energy consumptions of 5G BSs, introducing the configuration and components of base station microgrids (BSMGs), as well as categorizing the energy management systems (EMSs) and communication network. With the relentless global expansion of 5G networks and the increasing demand for data, communication base stations face unprecedented challenges in ensuring uninterrupted power supply and managing operational costs. This paper presents a brief review of BSMGEMS. Lithium batteries have emerged as a key component in ensuring uninterrupted connectivity, especially in remote or off-grid locations. Modern communication networks are driven by a need for reliability and efficiency. Energy storage solutions play an essential role in maintaining the operational integrity. As global 5G deployments surge to 1.3 million sites in 2023, have we underestimated the energy storage demands of modern communication infrastructure?

A single macro base station now consumes 3-5kW – triple its 4G predecessor – while network operators face unprecedented pressure to maintain uptime.
