

Latest geothermal technology trends

Overview

Enhanced geothermal systems could provide constant, low-cost, clean electricity while reducing land use and infrastructure needs in a global renewable energy transition. The technology could replace coal and nuclear as a baseload power source and support growing electricity demand. Following a successful Geothermal Innovation Days in Strasbourg (3 - 4 December 2025), ETIP Geothermal is proud to present the second edition of the Geothermal Innovation Trends report, which has been produced in partnership with the European Geothermal Energy Council (EGEC). The geothermal sector. Geothermal systems, particularly ground-source heat pumps (GSHPs), exhibit high energy efficiency, with coefficients of performance (COP) ranging from 3.0, while deep geothermal systems operate at temperatures of 50°C–200°C, supporting both power generation and large-scale heating. A Stanford study finds that adding geothermal power cuts wind, solar, and battery capacity requirements while keeping energy costs low. Conventional geothermal electrical generation only works where naturally permeable, water bearing hot rock exists close enough to the surface. Get ThinkGeoEnergy in your inbox today!
