

Lightning protection for solar thermal power plants

Overview

Lightning (surge) arrestors are designed to absorb voltage spikes caused by electrical storms (or out-of-spec utility power), and effectively allow the surge to bypass power wiring and your equipment. Grounding is the most fundamental technique for protection against lightning damage. An electrical path to ground will constantly. Lightning can cause photovoltaic (PV) system failures as lightning that strikes the system from a great distance away, or even between clouds, can generate high-voltage surges. These systems aim to mitigate risks associated with lightning-induced surges in voltage and current. While solar systems will always remain in highly exposed environments, they can be designed to be safe from the effects of lightning. Solar Photovoltaic (PV) plants are always wide spread and isolated extentions or roof top installations. The typical placement of these systems on.

Lightning protection for solar thermal power plants

Risk assessment, lightning protection, and earthing system design for

Therefore, effective lightning protection measures including the use of surge protective devices, lightning rods, earthing systems, and shielding techniques are crucial to ensure the reliable ...
