

New Energy Storage Chip

Overview

New microcapacitors developed by scientists show record energy and power densities, paving the way for on-chip energy storage in electronic devices. Researchers are striving to make electronic devices smaller and more energy-efficient by integrating energy storage directly onto. Fitness trackers, internet-connected thermostats and other smart devices offer many benefits, but their growing popularity is driving up energy consumption, along with the need for more efficient energy storage solutions in small sizes. Miniaturized energy storage devices, such as electrostatic nanocapacitors and electrochemical micro-supercapacitors (MSCs), are important components in on-chip energy supply systems, facilitating the development of autonomous microelectronic devices with enhanced performance and efficiency.
