

No aging solar power generation

Overview

Wind turbines and solar panels are not living up to their longevity claims, increasing costs and filling up waste disposal sites. As 2025 kicks off with new leadership, the U. faces new challenges like a rapidly growing demand of electricity driven in large part by data center expansion, electric vehicle adoption, bitcoin mining operations, and continued industrial growth. In 2023, more than 67 GW of solar capacity turned 20 years old – and their performance showed their age as components became less efficient and more. Reliability plays a huge role in the lifetime costs and performance of solar modules and systems. These high-tech semiconductor devices must continue generating electricity for 30 to 40 years of sun, wind, hail, snow, and heat.

No aging solar power generation

US solar farms are aging. Is it time to begin repowering?

Some 23 GW of U.S. solar farms contain inverters that will need to be replaced over the next five years. But repowering might not unfold in the solar industry the same way it did for wind.
