

# Photovoltaic panel pollution suggestions

## Overview

---

This section addresses baseline environmental assessment prior to construction, stormwater management, leaching of metals from panels, stray voltage concerns, radiation and electromagnetic fields, impacts to wildlife, and disposal or recycling of panels at the end of. This section addresses baseline environmental assessment prior to construction, stormwater management, leaching of metals from panels, stray voltage concerns, radiation and electromagnetic fields, impacts to wildlife, and disposal or recycling of panels at the end of. Making solar panels creates pollution and uses harmful chemicals. For instance, the International Renewable Energy Agency (IRENA) estimates that by 2050, discarded solar panels could amount to 78 million tons of waste globally. When these panels get old, recycling them is expensive and difficult. Solar energy technologies and power plants do not produce air pollution or greenhouse gases when operating. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment.
