

Photovoltaic panel wiring caught fire

Overview

Design flaws, component defects, and faulty installation can cause a rooftop solar system to start a fire. As with all electrical systems, these problems can cause arcs between conductors or to the ground, as well as hot spots, which can ignite nearby flammable material. That's why the Solar Energy Technologies Office (SETO) funded the Solar Training and Education for Professionals (STEP) program, which provides tools to more than 10,000 firefighters and fire code officials to manage solar equipment as they put out fires. Learn more about the STEP funding program. Solar panels gleaming on rooftops have become a common sight across America, but a nagging question persists in many homeowners' minds: can these electrical systems actually catch fire?

The short answer is yes – but before you panic, the reality is far more reassuring than the fear. How often do. While the overall fire risk is extremely low, understanding what causes solar panels to catch fire is crucial for protecting your property and maximizing your investment. Most PV modules are tested by Underwriters Laboratories (UL), which subjects them to the rigors of everyday use before they are certified.
