

Photovoltaic panels with radiation

Overview

No, solar panels do not emit harmful radiation that poses a risk to human health or the environment. They primarily absorb sunlight and convert it into electricity, functioning more like giant light absorbers than emitters. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment. Electromagnetic radiation refers to the process by which electromagnetic waves spread outward in the form of waves. These waves include radio waves, microwaves, infrared, visible light, ultraviolet rays, X-rays, gamma rays, and more, spanning a wide range of frequencies from low to high.

Photovoltaic panels with radiation

How do solar panels work? Solar power explained

In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.
