

Requirements for the climbing distance of wind power stations at communication base stations

Overview

(1) Base stations with an emission bandwidth of 1 MHz or less are limited to 1640 watts equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT, except as described in paragraph (b) below. If. Statement - Joint FCC OSHA Statement on Tower Climber Safety Guide. This section applies to all Reclamation employees, contract workers, contractors, and subcontractors that work on communication towers, antennas, and antenna supporting structures, where workers are exposed to potential falls at heights. General Requirements Each region must designate a. What is the maximum distance between antenna and wind tunnel test?

the maximum value between the antenna width and thickness. If both the width and thickness of the antenna are less than 300 mm, the distance between wind tunnel test must be greater than or equal to 300 mm.
