

# Solar cell power generation into the grid

## Overview

---

Electricity flows back into the grid from solar panels through an inverter, which converts the direct current (DC) electricity generated by the panels into alternating current (AC) electricity compatible with the electrical grid. Solar systems integration involves developing technologies and tools that allow solar energy onto the electricity grid, while maintaining grid reliability, security, and efficiency. There are two forms of energy generated from the sun for our use – electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural. Understanding how electricity flows back into the grid is essential for solar panel owners as solar power gains popularity. We will explore the process, benefits. A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Sunlight is composed of photons, or particles of solar energy.
