

Solar panel light-following system

Overview

A solar tracking system (also called a sun tracker or sun tracking system) maximizes your solar system's electricity production by moving your panels to follow the sun throughout the day, optimizing the angle at which your panels receive solar radiation. This project involves designing and building a light-following solar tracker system using a Proportional-Integral-Derivative (PID) controller. The primary objective of the system is to maximize the efficiency of a solar panel by ensuring it remains aligned with the light source, typically the sun. Solar trackers are devices that allow your solar panel array to follow the sun's path in the sky to produce more energy for you to use. Solar tracking systems do come with a high price tag.

Solar panel light-following system

How to track light with solar panels , NenPower

Light tracking technology operates by utilizing either single-axis or dual-axis mechanisms, each providing differing degrees of sunlight orientation. Single-axis trackers rotate on one axis, ...

Sun-Tracking Solar Panels Pros and Cons: Are They Worth It?

Following the sun's path, tracking solar panels move through one complete rotation daily, either mounted on a single-axis or dual-axis tracker. Using a single-axis tracker, solar panels operate ...

Building your own Sun Tracking

Solar Panel using an Arduino

We measure the intensity of light with LDRs using Arduino and compare the intensity of light falling on both LDRs. The LDRs are placed on the edges of the solar panel as shown in the ...
