

Solar power generation in the last decade

Overview

produced more solar power in 2023 than ever before – part of a decade-long growth trend for renewable energy. solar and wind energy data from 2014 to 2023 for all 50. The U. Electricity generation by the U. electric power sector totaled about 4,260 billion kilowatthours (BkWh) in 2025. In our latest Short-Term Energy Outlook (STEO), we expect U. 6% in 2027, when it reaches an annual total of 4,423 BkWh. Wind power has more than doubled this decade, with 425,325 GWh coming from win installations across. A report from Environment America shows how solar and other decarbonized technologies are quickly replacing fossil fuels. The past decade has shown a rise in renewable energy from an alternative source to an increasingly important feature in the United States energy mix. Solar alone has grown an impressive eightfold in 10 years.

Solar power generation in the last decade

New report: Wind & solar energy tripled in US over past decade

"Solar panels, wind turbines, electric vehicles and battery storage are benefiting people in all 50 states, providing the building blocks of a clean energy system free from dirty fossil fuels."

Renewable electricity generation, including wind, solar,

hydroelectric, geothermal, and biomass/waste, has nearly tripled over the past two decades. Wind and solar energy drove the growth in renewable generation in this period. In 2022, renewables generated more electricity than coal-fired sources for the first time. The top three renewable sources See more on [epa.gov/ctfa/sets](https://www.epa.gov/ctfa/sets) [PDF]

A Decade of Growth in Solar and Wind Power

Small-scale solar produced an estimated 73,619 GWh or about 31% of all solar generation in 2023 -- compared to 164,502 GWh generated by utility-scale installations.
