

Storage time requirements for lithium batteries

Overview

Lithium batteries can be safely stored for approximately 2 to 3 years if stored according to proper procedures. However, over time, the chemical activity inside the battery will gradually decrease, and capacity loss is unavoidable. When the lithium battery temperature is -20 to 5°C and there is an incoming charge current over 10 amps, self-heating can occur. The result can be the release of gas, which can cause fires, and even explosions. Furthermore, if you store groups of these batteries together in a space, one battery or. Burning lithium-ion batteries can release molten material and hazardous liquids. Storage areas should include liquid-tight containment systems to prevent environmental contamination.

Storage time requirements for lithium batteries

Best Practices for Charging, Maintaining, and Storing Lithium Batteries

By implementing storage guidelines, charging practices, and avoiding excessive discharge, you can ensure that your batteries perform optimally for a longer duration. To better understand how battery ...
