

The battery in the energy storage cabinet has white crystals

Overview

The white, crusty substance that may appear on this type of battery is potassium carbonate, formed when the potassium hydroxide from the battery leaks and reacts with carbon dioxide in the air. Potassium carbonate is dangerous if ingested and can potentially cause skin irritation or. The white crusty stuff on batteries can be dangerous in traditional wet cell (lead-acid) batteries, commonly used for starting cars and powering other heavy-duty equipment. However, it is not harmful if found on an alkaline (dry-cell) battery in portable devices such as laptops. You're not. Although the white substance from battery leakage isn't inherently toxic, it needs to be handled carefully and cleaned up using the correct methods to avoid potential harm. Your battery type plays a key role in the formation of this build-up.
