

The life of a wind power system

Overview

Modern wind turbines are designed to last 20 years and with proper monitoring and preventative maintenance two to three times per year (increasing with frequency as the turbine ages) their lifetime can be extended to 25 years [6]. With higher efficiency modern turbines due to additional electronic components and a more powerful and massive design, there is a. As enthusiasm to harness offshore wind energy hits a high, here's the lowdown on what affects its long-term viability. The amount of renewable energy available will be tripled and energy-efficiency improvements doubled by 2030. Made of fibreglass, wind turbine blades usually end up in landfill. From site planning to final dismantling, each stage of a turbine's life cycle demands precision, coordination, and long-term vision. Here's what that journey looks like.
