

# The photovoltaic panel has voltage but no response

## Overview

---

A faulty inverter or charge controller are the most likely reasons for a solar panel to register no voltage. Other possible reasons for low to zero power are a damaged PV module, poor wiring, shading and temperature higher than the ideal operating range. Most of those users don't know the reasons and the way they can get rid of this. The resettable fuse breaker is cheap, the volts got through but not allowing current, so the MPPT did not send any current. I have both 2 yr old ones. Are your solar panels not working properly?

Is your inverter giving a warning light on its display?

There must be a technical issue with your system while producing and delivering the desired amount of power. Troubleshooting basic issues is something that every homeowner should be aware of. If you. But what happens if the solar panel has no voltage or very low power?

What should you do?

These are actually common problems and there are ways you can fix them. Checking Voc (voltage open circuit) and Isc (current short circuit) measurements can help diagnose panel issues.
