

# The relationship between solar power generation and solar panels

## Overview

---

Both are generated through the use of solar panels, which range from those found on rooftops of our homes and businesses to 'solar farms' stretching across acres of land. And, unlike the burning of fossil fuels, sunlight converts into power without creating harmful greenhouse gases. Yes, solar power is a renewable and infinite energy source that creates no harmful greenhouse gas emissions – as long as the sun continues to shine, energy will be released. The carbon footprint of solar panels is already quite small, as they last for over 25 years. Over time, people developed technologies to harness the physics of how this transformation from sunlight to usable energy occurs, which is as elegant as it is profound. When sunlight hits the surface of these panels, it triggers a reaction. Solar energy can be harnessed in two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for domestic uses, to warm buildings, or heat fluids to drive electricity-generating turbines.

## The relationship between solar power generation and solar panels

---

### Solar energy

Solar cell When sunlight strikes a solar cell, an electron is freed by the photoelectric effect. The two dissimilar semiconductors possess a natural difference in electric potential (voltage),
