The top of the short column is set with an embedded steel plate (or embedded bolt) to connect with the upper photovoltaic bracket, which requires a certain burial depth and a certain foundation bottom area; the foundation bottom plate is covered with soil, and the self-weight of. The top of the short column is set with an embedded steel plate (or embedded bolt) to connect with the upper photovoltaic bracket, which requires a certain burial depth and a certain foundation bottom area; the foundation bottom plate is covered with soil, and the self-weight of. At its core, the primary function of a PV support bracket is to provide robust structural support for solar panels. Solar panels are exposed to a variety of environmental forces, including wind, snow, and seismic activity. Without proper support, these panels can be easily damaged or dislodged. Photovoltaic roof mounting systems (also known as PV support structures) serve as the critical components connecting solar panels to building roofs. Their design and selection directly determine the system's safety, power generation efficiency, and service life. It is a crucial part of solar systems. The difference between it and the traditional bracket is that the photovoltaic bracket needs to be customized according to the size and shape of the solar panel to meet.
