

# The whitening of photovoltaic panels affects the temperature

## Overview

---

High temperatures significantly influence the performance and efficiency of photovoltaic (PV) systems. Temperature Coefficient is Critical for Hot Climates: Solar panels with temperature coefficients of  $-0.30\%/^{\circ}\text{C}$  or better (like SunPower Maxeon 3 at  $-0.30\%/^{\circ}\text{C}$ ). You'll learn how to predict the power output of a PV panel at different temperatures and examine some real-world engineering applications used to control the temperature of PV panels. This study explores innovative cooling techniques, including water-based cooling and colour filter applications, to mitigate the impact. The negative effect of the operating temperature on the functioning of photovoltaic panels has become a significant issue in the actual energetic context and has been studied intensively during the last decade. Photovoltaic (PV) panels convert solar energy directly into electrical energy through semiconductor materials.
