

# Three branches of emergency power

## Overview

---

The NEC Article 517 requirements are consistent with NFPA 99 for EES Type 1, and is comprised of three separate branches (life safety, critical, and equipment). However, EES Type 2, which is comprised of two separate branches (life safety and equipment), is only mentioned in. This essential electrical system must be divided into three branches, including the: Both the life safety branch and the critical branch are kept independent of all other wiring and equipment, and transfer within 10 seconds of an electrical interruption. " The term "emergency" is no longer referenced as a defining quantification in Art. However, other sections of the NEC still. Consequently, standby power is required for all essential electrical systems (EESs), which include evacuation/egress lighting, HVAC systems for patient care and operating rooms, critical process equipment (such as medical imaging devices) and fire suppression equipment to aid response teams in the. There are several codes and standards that govern emergency power requirements for the hospitals, including: It establishes the minimum criteria for the installation, performance, and operation of a wide range of systems and equipment in health care facilities to ensure the safety of patients. As defined in NFPA 70: National Electrical Code (NEC), there are three types of emergency and standby power systems: emergency power, legally required standby power, and optional standby power.
