

Uninterrupted power supply for ship-to-shore communication base station

Overview

Marine UPS systems are designed to bridge those gaps, providing instant backup power to keep essential equipment running smoothly through temporary outages and power fluctuations. Think of a marine UPS battery backup as an insurance policy for your ship's critical electrical. When it comes to shipboard electrical systems, power continuity is paramount. Imagine a sudden blackout. Many of the Marinas, Ports and Harbour operators are now offering visiting vessels the opportunity to “plug into” the local city power supply grid at dockside power distribution points so the on board diesel engine generators can be turned off while the vessel is in port. Equipped with a battery backup, a UPS ensures operational continuity. The UPS should meet the general requirements set out in regulation IV/13 of SOLAS 1974, as amended, and in resolution A. 694 (17), as applicable, and should also comply with the following requirements. See below for a selection of our UPS solutions that we recommend for use in marine and offshore applications. Don't. Uninterruptible Power Supplies on ships are assumed to be invisible heroes. They sit quietly behind navigation equipment, control systems, communication racks, DP consoles, and automation cabinets. When they work, nobody notices.

Uninterrupted power supply for ship-to-shore communication base

Uninterruptible power supply (UPS) for marine and offshore , Eaton

Protect offshore applications like control, safety and communications with Eaton uninterruptible power supply (UPS) solutions for marine applications.
