BESS

Overview

From mountainous pumped hydro to cutting-edge cryogenic and compressed air technologies, the UK is deploying a broad portfolio of energy storage solutions to ensure energy security, decarbonisation, and grid resilience. The UK's battery storage sector is charging ahead at an incredible pace. Since 2020, operational capacity has increased by 509%, climbing from 1,128 MW to 6,872 MW in 2025. So far this year, more than 1,405 MW of new capacity has been commissioned, already beating the total for 2024 and putting the. Long Duration Electricity Storage (LDES) facilities provide vital back-up for the renewable power system - working like giant batteries that store electricity created by wind and solar farms, then release it to the grid when needed. Energy storage is vital for the management of supply-demand dynamics and the unleashing of system flexibility, as the power sector is to be decarbonised by 2035 and a net-zero emissions target is set by 2050. The deployment of large-scale batteries is being encouraged by a reformed Capacity Market. The UK's journey to net zero will be impossible without large-scale energy storage.
