

What is a small wind power system

Overview

A small wind energy system has a power output as much as 100 kilowatts. A 100-kilowatt turbine operating in a sufficiently windy location (on average 12MPH) can produce enough electricity over a year for 20 typical homes. Harnessing the wind to make electricity and meet at least a portion of your power needs provides immediate and long-term environmental and financial benefits. Why Wind?

Wind is one of the great renewable energy resources on the planet because it is in limitless supply. They are often used in remote locations to power small electronic devices such as weather stations or. The main parts of small wind turbines are: turbines: they are the parts of the whole system that are responsible for energy production.
