

What to do if there is a communication base station and wind power on the roof

WORKING PRINCIPLE

Overview

The only way to be certain that you don't have lightening damage is to disconnect power and coax if storms are approaching. A ground will make things work better but if on your roof harder to ground. Yes attach to your mount and run to a ground rod near your house. Any direct strike is going to cause a lot of issues, damage and injury. You'd need a substantial grounding system to dissipate a direct strike. Base station antennas are installed in such a way that radio-wave exposure in public areas is well below the established safety limits. The base station antennas transmit and receive RF (radio frequency). If you put an antenna on a tower, are they each separately grounded, or does the tower ground take care of everything that's attached to it?

If everything is properly grounded, is it still best to disconnect your coax, (If able to) during an electrical storm, or is your equipment safe?

Isn't there. Building new towers or collocating antennas on existing structures requires compliance with the Commission's rules for environmental review. The National. A few states, including Oregon, North Dakota, and Minnesota, have state siting councils or boards that have "one-stop" mandatory siting jurisdiction over permits for wind energy facilities exceeding certain sizes.
