

# **Wind power environmental assessment does not have power generation indicators**

## Overview

---

Traditional performance metrics and power curve models often fail to provide reliable cross-turbine comparisons because they neglect multivariate environmental factors and turbine-specific biases. To address these limitations, this study develops a novel multivariate environmental factor-driven. This paper approaches in a didactic manner the Life Cycle Assessment (LCA) methodology for wind turbines, starting from the definition of the purpose and limits of the LCA system, continuing with the Life Cycle Inventory—LCI, and Life Cycle Impact Assessment (LCIA). This methodology is applied as. In today's rapidly evolving renewable energy landscape, effective environmental impact assessment is more than a regulatory obligation – it is a strategic opportunity to align sustainable practices with business intelligence and data analytics. As the wind electric power generation industry grows. The article presents a methodology for expert assessment of renewable energy facilities, in particular wind power plants (WPPs), on the environment. It involves using wind turbines to convert the turning motion of blades, pushed by moving air (kinetic energy) into electrical energy (electricity). Modern wind turbines are.

## Wind power environmental assessment does not have power genera
