

Wind turbine generator gear

Overview

The four most common types of gears found in wind turbines are spur gears, helical gears, bevel gears, and planetary gears. To transmit force, their straight teeth mesh with another gear. A wind turbine's gearbox is an integral part of the machine, as it is responsible for transmitting mechanical energy from the blades to the generator to produce electricity. This article will examine the gears used in wind turbines, from their design and applications to the difficulties encountered. A gearbox is typically used in a wind turbine to increase rotational speed from a low-speed rotor to a higher speed electrical generator. A common ratio is about 90:1, with a rate 16.7 rpm input from the rotor to 1,500 rpm output for the generator. At the heart of this process are components that ensure smooth power transmission—namely, the wind turbine gear and gearbox.

Wind turbine generator gear

A Revised International Standard for Gearboxes in Wind Turbine ...

The IEC 61400-4 standard for wind turbine gearbox design is currently being revised by a group of experts in IEC TC 88 (wind energy generation systems) and ISO TC60 (gears).
